Homework 12

Most of the code for this assignment is given in the directory. You need to make some of the inheritance virtual, and you need to add base class constructor calls and attribute initializations to the initializer lists of the constructors. When you are finished, your code should compile and when run give the following output:

Creating a new Student
Person
Student

Creating a new Teacher
Person
Teacher

Creating a new TA
Person
Teacher
Student
TA

What to turn in:

Turn in your code in a directory called *userid*, where *userid* is your Purdue login id. Include a make file that builds and runs your program. Zip up the *userid* directory and turn it into Brightspace.
